

TECH STACK & INFRA — DS SCIENCE ACADEMY WEBSITE

internal note, Mentora Tech Solutions

1. Stack

Frontend	Next.js 14 (App Router), React, TypeScript
Styling	Tailwind CSS
Backend	Next.js API routes, same app, no separate backend service
ORM	Prisma
DB	PostgreSQL, hosted on Supabase
Auth	JWT (jose), httpOnly cookies
File storage	Supabase Storage
Build	Docker
Hosting	Railway, auto-deploy on git push
VCS	Private git repo, dedicated to this project

2. Infra is dedicated, not shared

- Own repo. Not a branch or fork of anything else, own commit history.
- Own Supabase project — own Postgres instance, own storage bucket.
- Own Railway service — own domain, own env vars, own secrets.
- Own auth — sessions and password hashes scoped to this app's own users table. No shared login with any other product.

3. Commit history

First commit	12 Aug 2026
Last commit	04 Sep 2026
Total commits	81, ongoing
Pattern	Page by page, feature by feature — layout, admin wiring, bug fixes, one thing at a time. Not a single bulk import.

Every commit has a timestamp, message, and diff. That log is the record — can walk through it directly if needed.

4. On the "copied" question

Some existing coaching-site layouts (header nav, footer columns, a toppers section — standard stuff across this industry) were looked at for layout ideas. Referencing a layout pattern is not copying code. Nothing was copied — no markup, no assets, no code.

Every component and page here was written for DS's own content and data, and it's in DS's own repo, own history, from day one (Section 3).

5. Data isolation

Everything entered through the DS admin panel — students, faculty, enquiries, content — sits in this project's own DB only. Not shared, not mirrored, not visible from anywhere else.

6. Security

- Secrets (DB creds, JWT key, storage keys) live in env vars on Railway. Never in the repo.
- Passwords are hashed, never stored plain.
- Backups handled by Supabase.
